We represent $L^{S}(\pi \times \tau, s)$ by Rankin-Selberg integrals in terms of Gelfand-Graev coefficients of π paired against π' .

They involve an Eisenstein series on $SO_{6n+1}(\mathbb{A})$, induced from $\tau |\det \cdot|^s \otimes \pi'$. In fact, the Rankin-Selberg integral, in this case, is a Gelfand-Graev coefficient of this Eisenstein series paired against π (or vice versa).

We get that this Eisenstein series has a pole at $s = \frac{1}{2} + s_0$.

イロト イポト イヨト イヨト

We show that if π satisfies [b'], then π has a Gelfand-Graev model with respect to an irreducible, automorphic, cuspidal,

generic representation π' of SO_{2n+1}(A).

Assumption [a] implies that π' lifts to τ .

The point is that by Assumption [a], $L^{S}(\pi \times \tau, s)$ has a pole at $s = 1 + s_{0}$.

We represent $L^{S}(\pi \times \tau, s)$ by Rankin-Selberg integrals in terms of Gelfand-Graev coefficients of π paired against π' .

They involve an Eisenstein series on $SO_{6n+1}(\mathbb{A})$, induced from $\tau |\det \cdot|^s \otimes \pi'$. In fact, the Rankin-Selberg integral, in this case, is a Gelfand-Graev coefficient of this Eisenstein series paired against π (or vice versa).

We get that this Eisenstein series has a pole at $s = \frac{1}{2} + s_0$. Eventually, $L(\pi' \times \tau, s)$ has a pole at $s = \frac{1}{2} + s_0$. Hence $s_0 = \frac{1}{2}$, τ is symplectic and π' lifts to τ .
Thus, we need an assumption which is a little weaker than [b'].

イロト 不得 とくほ とくほとう

ъ

Thus, we need an assumption which is a little weaker than [b']. **[b'']** π has a Gelfand-Graev model with respect to an irreducible, automorphic, cuspidal, generic representation π' of $SO_{2n'+1}(\mathbb{A})$. It corresponds to the partition $(2(m+k-n')-1, 1^{2n'+1})$.

-

Thus, we need an assumption which is a little weaker than [b']. **[b'']** π has a Gelfand-Graev model with respect to an irreducible, automorphic, cuspidal, generic representation π' of $SO_{2n'+1}(\mathbb{A})$. It corresponds to the partition $(2(m+k-n')-1, 1^{2n'+1})$.

The corresponding unipotent group and character are of the form

$$\begin{pmatrix} z & x & y \\ I_{2n'+2} & x' \\ & z^* \end{pmatrix}$$

$$\rightarrow \psi_{Z_{m+k-n'-1}}(z)\psi(x_{m+k-n'-1,n'+1} - \frac{\alpha}{2}x_{m+k-n'-1,n'+2}),$$

 $z \in Z_{m+k-n'-1}, \quad \alpha \in F^*.$ This is the information we need, so that we can use the Rankin-Selberg integrals, as above.

The Eisenstein series is now on $SO_{2(m+n')+1}(\mathbb{A})$, and is induced from $\tau |\det \cdot|^s \otimes \pi'$.

イロト イポト イヨト イヨト

ъ

The Eisenstein series is now on $SO_{2(m+n')+1}(\mathbb{A})$, and is induced from $\tau |\det \cdot|^s \otimes \pi'$. Exactly as before, we get that it has a pole at $s = \frac{1}{2} + s_0$ and so does $L^S(\pi' \times \tau, s)$.

 $\begin{array}{c} \text{Some Basic Notations} \\ \textbf{A Class of Certain CAP Representations} \\ \text{The Main Theorems} \\ \text{On Proofs} \\ \text{Proof of Cuspidality of } \sigma: A Simple Case \\ \text{Proof that } \sigma \text{ is Nontrivial: A Simple Case} \end{array}$

The Eisenstein series is now on $SO_{2(m+n')+1}(\mathbb{A})$, and is induced from $\tau |\det \cdot|^s \otimes \pi'$. Exactly as before, we get that it has a pole at $s = \frac{1}{2} + s_0$ and so does $L^S(\pi' \times \tau, s)$. Hence $s_0 = \frac{1}{2}$, τ is symplectic, and, in particular, m = 2n must be even. Also, it follows that $n \le n'$ and τ figures in the isobaric sum, which is the lift of π' to $GL_{2n'}(\mathbb{A})$.

 $\begin{array}{c} \text{Some Basic Notations} \\ \textbf{A Class of Certain CAP Representations} \\ \text{The Main Theorems} \\ \text{On Proofs} \\ \text{Proof of Cuspidality of } \sigma: A Simple Case \\ \text{Proof that } \sigma \text{ is Nontrivial: A Simple Case} \\ \end{array}$

Assumption [b'] is related to Assumption [a] with the addition that τ is symplectic and $s_0 = \frac{1}{2}$.

Assumption [b'] is related to Assumption [a] with the addition that τ is symplectic and $s_0 = \frac{1}{2}$. For almost all finite places *v* where π_v , τ_v , σ_v are unramified, we can write

ヘロン 人間 とくほ とくほ とう

1

Assumption [b'] is related to Assumption [a] with the addition that τ is symplectic and $s_0 = \frac{1}{2}$. For almost all finite places v where π_v , τ_v , σ_v are unramified, we can write

$$\tau_{\mathbf{v}} = \operatorname{Ind}_{\operatorname{B}_{\operatorname{GL}_{2n}}(F_{\mathbf{v}})}^{\operatorname{GL}_{2n}(F_{\mathbf{v}})} \chi_{1} \otimes \chi_{1}^{-1} \otimes \cdots \otimes \chi_{n} \otimes \chi_{n}^{-1},$$

This follows from the fact that τ is symplectic; in particular, it is self-dual and has a trivial central character;

< 口 > < 同 > < 臣 > < 臣 >

Assumption [b'] is related to Assumption [a] with the addition that τ is symplectic and $s_0 = \frac{1}{2}$. For almost all finite places *v* where π_v , τ_v , σ_v are unramified, we can write

$$\tau_{\nu} = \operatorname{Ind}_{B_{GL_{2n}}(F_{\nu})}^{GL_{2n}(F_{\nu})} \chi_{1} \otimes \chi_{1}^{-1} \otimes \cdots \otimes \chi_{n} \otimes \chi_{n}^{-1},$$

This follows from the fact that τ is symplectic; in particular, it is self-dual and has a trivial central character;

$$\sigma_{\mathbf{v}} = \mathit{Ind}_{\mathit{BSO}_{2k}(\mathit{F}_{v})}^{\mathit{SO}_{2k}(\mathit{F}_{v})} \mu_{1} \otimes \cdots \otimes \mu_{k}.$$

< 口 > < 同 > < 臣 > < 臣 >

Since $s_0 = \frac{1}{2}$, we get that π_v is the unramified constituent of

David Soudry On CAP Representations of Even Orthogonal Groups

イロン 不得 とくほ とくほ とうほ

Since $s_0 = \frac{1}{2}$, we get that π_v is the unramified constituent of

$$\rho_{\chi,\mu} = \operatorname{Ind}_{\operatorname{B}_{Q_2n}(F_V)}^{SO_{4n+2k}(F_V)}\chi_1(\operatorname{det}) \otimes \cdots \otimes \chi_n(\operatorname{det}) \otimes \mu_1 \otimes \cdots \otimes \mu_k.$$

イロン 不得 とくほ とくほ とうほ

Since $s_0 = \frac{1}{2}$, we get that π_v is the unramified constituent of

$$\rho_{\chi,\mu} = \operatorname{Ind}_{\operatorname{BQ}_{2n}(F_{\nu})}^{SO_{4n+2k}(F_{\nu})}\chi_{1}(\operatorname{det}) \otimes \cdots \otimes \chi_{n}(\operatorname{det}) \otimes \mu_{1} \otimes \cdots \otimes \mu_{k}.$$

 $\rho_{\chi,\mu}$ has degenerate Whittaker models with respect to a unique maximal nilpotent orbit; it corresponds to the partition (2k + 2n - 1, 2n + 1).

イロト 不得 とくほ とくほとう

Since $s_0 = \frac{1}{2}$, we get that π_v is the unramified constituent of

$$\rho_{\chi,\mu} = \operatorname{Ind}_{\operatorname{BQ}_{2n}(F_{\nu})}^{SO_{4n+2k}(F_{\nu})}\chi_{1}(\operatorname{det}) \otimes \cdots \otimes \chi_{n}(\operatorname{det}) \otimes \mu_{1} \otimes \cdots \otimes \mu_{k}.$$

 $\rho_{\chi,\mu}$ has degenerate Whittaker models with respect to a unique maximal nilpotent orbit; it corresponds to the partition (2k + 2n - 1, 2n + 1).

Thus, π satisfying [a](with $s_0 = \frac{1}{2}$; τ symplectic, e.g. assume [b"]) is such that for any nilpotent orbit \mathcal{O} supporting Fourier coefficients on π , we must have

$$\mathcal{O} \leq (2k+2n-1,2n+1).$$

Since $s_0 = \frac{1}{2}$, we get that π_v is the unramified constituent of

$$\rho_{\chi,\mu} = \operatorname{Ind}_{B_{\mathcal{O}_{2^n}}(F_{\mathcal{V}})}^{SO_{4n+2k}(F_{\mathcal{V}})}\chi_1(\operatorname{det}) \otimes \cdots \otimes \chi_n(\operatorname{det}) \otimes \mu_1 \otimes \cdots \otimes \mu_k.$$

 $\rho_{\chi,\mu}$ has degenerate Whittaker models with respect to a unique maximal nilpotent orbit; it corresponds to the partition (2k + 2n - 1, 2n + 1).

Thus, π satisfying [a](with $s_0 = \frac{1}{2}$; τ symplectic, e.g. assume [b"]) is such that for any nilpotent orbit \mathcal{O} supporting Fourier coefficients on π , we must have

$$\mathcal{O} \leq (2k+2n-1,2n+1).$$

Hence [b'] says that π "attains" the maximum nilpotent orbit possible.

Let π be an irreducible, automorphic, cuspidal representation of $SO_{4n+2k}(\mathbb{A})$.

We are interested in π , whose lift to $GL_{4n+2k}(\mathbb{A})$ is "non-tempered". The first possible such case is when the lift of π has the form

 $Speh(\tau, 2)$ "tempered" = $Speh(\tau, 2)$ "lift(σ -cuspidal, generic)

We are interested in π , whose lift to $GL_{4n+2k}(\mathbb{A})$ is "non-tempered". The first possible such case is when the lift of π has the form

 $Speh(\tau, 2)$ "tempered" = $Speh(\tau, 2)$ "lift(σ -cuspidal, generic)

This means π must be CAP as before, with $s_0 = \frac{1}{2}$; $L^S(\pi \times \tau, s)$ has a pole at $s = \frac{3}{2}$, and the assumption on $\mathcal{O}(\pi)$ will show that τ must be symplectic.

イロト 不得 とくほ とくほとう

We are interested in π , whose lift to $GL_{4n+2k}(\mathbb{A})$ is "non-tempered". The first possible such case is when the lift of π has t

The first possible such case is when the lift of π has the form

 $Speh(\tau, 2)$ "tempered" = $Speh(\tau, 2)$ "lift(σ -cuspidal, generic)

This means π must be CAP as before, with $s_0 = \frac{1}{2}$; $L^S(\pi \times \tau, s)$ has a pole at $s = \frac{3}{2}$, and the assumption on $\mathcal{O}(\pi)$ will show that τ must be symplectic.

What we explained before proves that, conversely, the assumption on $\mathcal{O}(\pi)$ and the fact that $L^{S}(\pi \times \tau, s)$ has a pole at $s = \frac{3}{2}$ imply that τ is symplectic. This is first part of the following theorem which proves the converse.

Theorem

Let π be an irreducible, automorphic, cuspidal representation of $SO_{4n+2k}(\mathbb{A})$. Assume that $\mathcal{O}(\pi) = (2k + 2n - 1, 2n + 1)$.

Thus, when $\ell \geq 1$, we can factor our integral modulo the Adele points of the unipotent radical of Q_{ℓ} and the corresponding constant term of the cusp form φ_{π} appears as an inner integral, and hence we get zero.

It follows that only the trivial character may contribute to the Fourier expansion above ($\ell = 0$). Therefore our constant term (of σ along *V*) is equal to

$$\int_{\mathrm{SO}_{4+2k}(F)\backslash \mathrm{SO}_{4+2k}(\mathbb{A})} f^{U_k}(h)\varphi_{\pi}(h) dh.$$

It follows that *k* is even, and then one can express f^{U_k} in terms of a similar residual Eisenstein series Θ'_{τ} on $SO_{4+2k}(\mathbb{A})$.

It follows that *k* is even, and then one can express f^{U_k} in terms of a similar residual Eisenstein series Θ'_{τ} on $SO_{4+2k}(\mathbb{A})$. Of course, for $f' \in \Theta'_{\tau}$,

$$\int_{\mathrm{SO}_{4+2k}(F)\setminus\mathrm{SO}_{4+2k}(\mathbb{A})}f'(h)arphi_{\pi}(h)dh=0.$$

ヘロン 人間 とくほ とくほ とう

Consider constant terms of elements of σ along the unipotent radical of a standard maximal parabolic subgroup; its elements have the form

$$\begin{pmatrix} I_r & x & y \\ & I_{2(k-r)} & x' \\ & & & I_r \end{pmatrix}.$$

・ 回 ト ・ ヨ ト ・ ヨ ト

Consider constant terms of elements of σ along the unipotent radical of a standard maximal parabolic subgroup; its elements have the form

$$\begin{pmatrix} I_r & x & y \\ & I_{2(k-r)} & x' \\ & & & I_r \end{pmatrix}$$

Similar arguments show that this constant term is equal to

$$\int_{\mathrm{SO}_{4+2k}(F)\backslash \mathrm{SO}_{4+2k}(\mathbb{A})} f^{U_r}(h)\varphi_{\pi}(h) dh$$

く 同 と く ヨ と く ヨ と

$$\int_{\mathrm{SO}_{4+2k}(F)\backslash \mathrm{SO}_{4+2k}(\mathbb{A})} f'(h)\varphi_{\pi}(h) dh.$$

This is a tower property. We use that $O(\pi) = (2k + 1, 3)$ to show that the last integral is identically zero.

Let n = 1 and k = 2. We show that a Whittaker coefficient is nontrivial on σ . In particular, this implies that σ is nontrivial.

イロト イポト イヨト イヨト

1

Let n = 1 and k = 2. We show that a Whittaker coefficient is nontrivial on σ . In particular, this implies that σ is nontrivial. Using a simple conjugation by a Weyl element, we need to show that

$$\int_{\mathrm{SO}_8(F)\backslash \mathrm{SO}_8(\mathbb{A})} \varphi_{\pi}(h) \int_{F^2 \backslash \mathbb{A}^2} f\left(\begin{pmatrix} 1 & x & y & * \\ & 1 & 0 & -y \\ & & h & \\ & & & 1 & -x \\ & & & & 1 \end{pmatrix}\right) \psi^{-1}(x+y) dx dy dh$$

is not identically zero.

Consider the Fourier expansion of the following smooth function on $\mathcal{F}^8\backslash\mathbb{A}^8,$

David Soudry On CAP Representations of Even Orthogonal Groups

イロト 不得 とくほ とくほとう

Consider the Fourier expansion of the following smooth function on $F^8 \setminus \mathbb{A}^8$,

$$v \mapsto \int_{F^2 \setminus \mathbb{A}^2} f(egin{pmatrix} 1 & x & v & y & * \\ 1 & 0 & -y \\ & I_8 & v' \\ & & 1 & -x \\ & & & 1 \end{pmatrix} h) \psi^{-1}(x+y) dx dy.$$

イロト 不得 とくほ とくほとう

Consider the Fourier expansion of the following smooth function on $\mathcal{F}^8 \setminus \mathbb{A}^8$,

$$v \mapsto \int_{F^2 \setminus \mathbb{A}^2} f(egin{pmatrix} 1 & x & v & y & * \\ 1 & 0 & -y \\ & I_8 & v' \\ & & 1 & -x \\ & & & 1 \end{pmatrix} h) \psi^{-1}(x+y) dx dy.$$

The characters of *v* that appear in the Fourier expansion have the form $\psi(\langle v, e \rangle)$, where $e \in F^8$. We have the natural action of SO₈(*F*) on these characters.

ヘロン 不通 とくほ とくほ とう

Consider the Fourier expansion of the following smooth function on $\mathcal{F}^8\backslash\mathbb{A}^8,$

$$v \mapsto \int_{F^2 \setminus \mathbb{A}^2} f(egin{pmatrix} 1 & x & v & y & * \\ 1 & 0 & -y \\ & I_8 & v' \\ & & 1 & -x \\ & & & 1 \end{pmatrix} h) \psi^{-1}(x+y) dx dy.$$

The characters of v that appear in the Fourier expansion have the form $\psi(\langle v, e \rangle)$, where $e \in F^8$. We have the natural action of SO₈(*F*) on these characters.

We use again the fact that $((2)^{2k+2})$ is the maximal nilpotent orbit of Θ_{τ} to show that only the orbit of *e*, such that < e, e >= -2 contributes to the Fourier expansion.

Substitute the Fourier expansion. We get

$$\int_{\mathrm{SO}_8(F)\backslash \mathrm{SO}_8(\mathbb{A})} \varphi_{\pi}(h) \sum_{\gamma} \int_{F^{10}\backslash \mathbb{A}^{10}} f\left(\begin{pmatrix} 1 & u & * \\ & I_{10} & u' \\ & & 1 \end{pmatrix} \begin{pmatrix} I_2 \\ & & \gamma h \\ & & & I_2 \end{pmatrix}\right) \psi^{-1}(u_1+u_2-u_9+u_{10}) dudh,$$

イロト イポト イヨト イヨト

where $f' \in \Theta''_{\tau}$. This integral is the residue at $s = \frac{3}{2}$ of the Rankin-Selberg integral representing $L^{S}(\pi \times \tau, s)$; This integral is expressed in terms of the Gelfand-Graev model of π with respect to σ_{τ} . As we explained in the beginning, this coefficient is nontrivial.

Thus, we consider the integral

$$\int_{\mathrm{SO}_7(F)\backslash\mathrm{SO}_7(\mathbb{A})}\varphi_\pi(g)f'(g)dg,$$

where $f' \in \Theta''_{\tau}$. This integral is the residue at $s = \frac{3}{2}$ of the Rankin-Selberg integral representing $L^{S}(\pi \times \tau, s)$; This integral is expressed in terms of the Gelfand-Graev model

of π with respect to σ_{τ} . As we explained in the beginning, this coefficient is nontrivial.

Since $L^{S}(\pi \times \tau, s)$ has a pole at $s = \frac{3}{2}$, we conclude that the last integral is nontrivial. This proves that the ψ -Whittaker coefficient of σ is nontrivial and hence σ is nontrivial.
